

Responses to Claude Open Questions (Q1-Q7)

Q1 – Session Boundary

Remove the concept of active_contract. Partition all data by contract_symbol. Do not reconcile contracts using trading-day or UTC-day boundaries. Display UI times in America/Vancouver while preserving original timestamps in metadata/tooltips.

Q2 – Non-Outright Fallback

Parse the raw symbol dynamically and extract every valid contract token regardless of separators. Only classify as unknown if no valid contract exists anywhere in the raw symbol. Never use the 'no hyphen' fallback.

Q3 – Selection Criterion

Remove the entire active-contract selection mechanism rather than replacing its metric. Process every detected contract independently. Delete the MBO size-sum calculation if it is used only for active contract selection.

Q4 – Historical Footprint Cache

Invalidate/delete the derived footprint_candles cache once during deployment and rebuild it entirely from raw data using the corrected logic. Preserve raw data.

Q5 – Overlay Cap

No hard overlay limit. Use three overlays only as the default UI selection. All contracts remain retained, processed, selectable and available.

Q6 – Trigger Engine

The existing Trigger Engine is incompatible with the new contract-first architecture. Remove it completely from the processing pipeline and design a new upgraded Trigger Engine after the architecture is finalized.

Q7 – Spread Rendering

Treat spreads as first-class instruments. Keep every instrument in the global chronological timeline so no market event disappears. Render each instrument using its own dedicated analytical view (Outright DOM, Spread DOM, Synthetic View, etc.).
